Plan Overview

A Data Management Plan created using DMPonline.be

Title: Integrative Group Work 1 PMX006: Bictegravir

Creators: Seyed Mostafa Fazel Hoseini, n.n. n.n., Shanice Sokeng Tsake

Affiliation: Université catholique de Louvain (UCLouvain)

Template: UCLouvain

Principal Investigator: n.n. n.n.

Data Manager: Seyed Mostafa Fazel Hoseini

Project Administrator: Shanice Sokeng Tsake, n.n. n.n.

Project abstract:

This project investigates the pharmacokinetic properties of Gajeevy, an investigational drug with similarities to bictegravir, using data from a Phase Ia single ascending dose study involving 32 healthy volunteers. The work includes data quality assessment, data management following FAIR principles, non-compartmental analysis (NCA), exploratory covariate analysis, and compartmental modeling.

The provided dataset was assessed for missing values, outliers, and inconsistencies before preparation for pharmacokinetic analysis. NCA was performed using PKAnalix to estimate individual pharmacokinetic parameters. Associations between these parameters and demographic, physiological, and genetic covariates were explored, identifying body weight and age as potential contributors to pharmacokinetic variability. One- and two-compartment models were also evaluated, with the one-compartment model preferred based on information criteria.

The project aims to characterize the pharmacokinetic behavior of Gajeevy while ensuring transparent, well-documented, and reproducible data processing and analysis.

ID: 226408

Start date: 12-10-2026

End date: 23-10-2026

Last modified: 25-10-2026

Lifecycle stage: Working Draft

Integrative Group Work 1 PMX006: Bictegravir
GDPR - UCLouvain

Collecte et traitement des données à caractère personnel

Collectez-vous ou traitez-vous des données personnelles ?

- Oui

Collectez-vous ou traitez-vous des données personnelles primaires et/ou des données personnelles secondaires ?

- Données personnelles primaires

Si vous traitez des données personnelles secondaires, allez-vous informer les personnes dont les données personnelles sont traitées ou ont-elles déjà été informées ?

- Oui

Dans la négative, expliquez pourquoi il est impossible ou pourquoi cela impliquerait un effort disproportionné d'informer les personnes dont les données personnelles sont traitées.

Ma reponse précedente était oui

Catégories de données à caractère personnel et personnes concernées

Collectez-vous/traitez-vous l'une des catégories spéciales de données suivantes ?

- Des données biométriques permettant d'identifier une personne physique de manière unique, telles que les empreintes digitales, les images faciales et les scans de l'iris.
- Des données génétiques

Quelles sont les autres catégories de données personnelles que vous collectez/traitez ?

- Caractéristiques physiques (taille, poids...)

À qui appartiennent les données personnelles que vous collectez/traitez ?

- Autres (veuillez préciser ci-dessous)

Adultes et enfant de plus de 2ans

Votre recherche sera-t-elle sérieusement entravée si les personnes dont les données personnelles sont collectées/traitées exercent leur droit d'accès, de rectification, de limitation du traitement, d'oubli, de portabilité des données et/ou d'opposition ?

- Non

Si oui, veuillez justifier la nécessité de déroger à un ou plusieurs des droits mentionnés à la question 8. Une justification est requise pour chaque dérogation.

-

Finalité(s) du traitement

Quelle(s) est (sont) la (les) finalité(s) du traitement des données personnelles ?

Étude clinique de phase 1a afin de déterminer la concentrations plasmatiques, paramètres PK, exposition selon la dose et variabilité entre participants.

Quel est le fondement juridique du traitement ?

- La mission d'intérêt public de l'Université en matière de recherche

Si le traitement est fondé sur une *mission d'intérêt public* ou une *obligation légale*, précisez le motif ou la référence légale.

Il s'agit de travail de groupe universitaire

Un comité d'éthique de l'université, ou un comité d'éthique externe, a-t-il pris une décision sur l'étude proposée ? Si oui, veuillez préciser lequel.

non car c'est juste un projet de groupe

Responsabilité en matière de RGPD

Y a-t-il une autre université, un autre institut de recherche ou un autre partenaire impliqué dans la recherche (outre l'UCLouvain) ?

- Non : l'UCLouvain est le seul responsable du traitement des données

Si oui, veuillez préciser qui détermine les objectifs ("pourquoi") et les moyens ("comment") de la recherche.

- Celle-ci est déterminée en dehors de l'UCLouvain : l'UCLouvain est un sous-traitant (veuillez préciser ci-dessous les coordonnées du responsable du traitement des données et de son délégué à la protection des données).

Cette étude impliquera-t-elle le recours à des sous-traitants pour traiter les données personnelles ?

- Non

Veuillez préciser l'identité de ce sous-traitant

-

Transferts de données et catégories de destinataires

Est-ce que vous divulguez/partagez/transférez des données personnelles au-delà de votre équipe de projet, soit avec des destinataires de l'UCLouvain, soit avec des destinataires externes ?

No

Si oui, à ou avec quelles catégories de destinataires les données personnelles sont-elles divulguées/partagées/transférées ?

-

Si oui, où les données personnelles sont-elles divulguées/partagées/transférées ?

-

Quelle(s) est (sont) la (les) finalité(s) du transfert de données ?

-

Période de conservation

Quelle est la durée de conservation prévue pour les différentes catégories de données à caractère personnel ? Veuillez expliquer.

Question not answered.

Mesures de sécurité

Comment les données seront-elles stockées ?

- Disque dur d'ordinateur de bureau non chiffré

si la case "autre" a été cochée, veuillez fournir plus de détails sur ce stockage.

Question not answered.

Les données seront-elles rendues anonymes ou pseudo-anonymes ?

- Oui

Si les données n'ont pas été anonymisées ou pseudonymisées (c'est-à-dire si vous travaillez avec des données brutes), veuillez en indiquer brièvement les raisons.

-

Si les données sont conservées sur support papier, indiquez la méthode de stockage.

Question not answered.

si la case "autre" a été cochée, veuillez fournir plus de détails sur ce stockage.

Question not answered.

Analyse des risques

Pour analyser les risques éventuels liés au traitement des données personnelles, veuillez cocher les cases qui s'appliquent à cette recherche.

- La recherche porte sur des ensembles de données provenant d'une autre source ou d'une autre étude qui ont été ou seront appariés ou combinés.

La recherche constitue-t-elle un traitement à haut risque probable ? Si vous avez coché deux cases ou plus à la question 29, la réponse est "oui". Si la réponse est oui, merci de compléter la section "DPIA".

Question not answered.

Administrative Data

Date of first version

15/10/2026

Date of last version

26/10/2026

Data collection

What is the purpose of the data collection/generation and its relation to the objectives of the project?

The purpose of data collection is to support the early clinical development of Gajeevy, a novel investigational HIV-1 integrase strand transfer inhibitor (INSTI) with structural and mechanistic similarities to bictegravir.
The Phase Ia single ascending dose (SAD) study involves 32 healthy volunteers allocated to four parallel groups receiving single oral doses of 10, 25, 50 or 100 mg. The study aims to assess safety and tolerability, explore dose-limiting toxicity and the maximum tolerated dose where feasible, and characterise the initial pharmacokinetic (PK) and pharmacodynamic (PD) profile of Gajeevy.
The available concentration–time data will primarily support PK analyses, including the estimation of drug exposure, key pharmacokinetic parameters, dose proportionality and interindividual variability. Data will be managed according to FAIR principles, with documented quality control and reproducible analyses, to ensure reliable interpretation and support dose selection and the design of subsequent clinical trials.

To whom might the data be useful ('data utility')?

The data will primarily benefit the company's clinical pharmacology, pharmacometrics, biostatistics and drug development teams by providing an initial understanding of Gajeevy's pharmacokinetic behaviour.
The findings will help evaluate systemic exposure, dose proportionality and interindividual variability, supporting the selection of appropriate doses and the design of subsequent clinical trials.
The data may also support regulatory interactions and, where authorised, scientific collaborations with external researchers working on antiviral drug development.

What data will you collect or create?

The Phase Ia study generates pharmacokinetic data from 32 healthy volunteers receiving single oral doses of Gajeevy (10, 25, 50 or 100 mg).
The available dataset contains 320 longitudinal records, including participant identifiers, dosing information, plasma drug concentrations measured over time, demographic characteristics (age, sex and body weight), biochemical markers (albumin, CRP and creatinine) and pharmacogenetic variables (ABCG2, UGT1A1, CYP3A5 and ABCB1).
Derived datasets will include cleaned and validated data, concentration–time profiles, non-compartmental pharmacokinetic parameters, descriptive statistics, exploratory covariate analyses and proposed compartmental modelling outputs.
Safety, tolerability and pharmacodynamic data would be managed separately if collected under the clinical study protocol.

How will the data be collected or created?

Clinical data will be generated according to the Phase Ia study protocol through oral drug administration, scheduled blood sampling and laboratory measurements.

Plasma concentrations will be linked to participant identifiers, sampling times and administered doses. The resulting dataset will undergo systematic quality control to identify missing values, duplicates, inconsistencies and potential outliers.

The original dataset will be preserved unchanged, while cleaning and data transformation procedures will be documented in R. Pharmacokinetic parameters will be derived using PKanalix, and subsequent analyses will be performed in R, with the workflow documented in a reproducible Quarto dashboard.

Data documentation and metadata

How will you document the data?

Data documentation will include a data dictionary specifying variable names, definitions, measurement units, coding conventions and missing-value rules.

Study metadata will describe the study design, dose groups, sampling schedule and data provenance. All data-cleaning decisions, transformations and exclusions will be recorded to ensure traceability.

R scripts, PKanalix analysis settings, software versions and derived results will be documented in a reproducible Quarto dashboard. Consistent file naming and version control will facilitate data interpretation, verification and reuse throughout Gajeevy's clinical development.

Ethical and legal issues

How will you manage any ethics and confidentiality issues?

As the clinical trial sponsor, the company will ensure that the study complies with applicable ethical and regulatory requirements, including Good Clinical Practice (GCP), GDPR and relevant clinical trial regulations.

Appropriate ethics approval and informed consent will be required before participant enrolment. Personal and pharmacogenetic data will be pseudonymised, with direct identifiers stored separately and access restricted to authorised personnel.

Data processing will be limited to legitimate study purposes, with appropriate security measures, confidentiality agreements and procedures for handling potential data breaches.

How will you manage intellectual property rights issues?

Intellectual property rights relating to Gajeevy, its development data and proprietary analytical results will be managed under the company's intellectual property policies and applicable contractual agreements.

Confidential research information will be protected, particularly where disclosure could affect patentability or commercial development.

Data generated through external collaborations will be governed by agreements defining ownership, permitted use, publication rights and confidentiality obligations. Any external dissemination will require appropriate internal review and authorisation.

Storage and backup

How will you store and backup data during research?

Clinical study data will be stored in a secure, access-controlled company environment, with separate locations for original datasets, validated datasets, analysis scripts and generated results.

Regular automated backups, version control and integrity checks will be implemented to prevent data loss and preserve traceability. Access permissions will be assigned according to staff responsibilities, with appropriate protection of participant-

level data.
Backup and recovery procedures will be documented and maintained in accordance with company quality standards and applicable clinical trial requirements.

How will you ensure that stored data are secure?

All clinical study data generated during Gajeevy's Phase Ia trial will be stored in secure, company-managed systems with encryption and access restricted to authorised personnel based on their responsibilities.
Participant data will be pseudonymised, with identifying information and re-identification keys stored separately under stricter access controls. Authentication mechanisms, audit trails and regular security monitoring will be implemented to prevent unauthorised access or modifications.
Data transfers will use secure, encrypted channels, and regular backups will be maintained to protect against data loss. These measures will comply with GDPR, Good Clinical Practice (GCP) and applicable company data security policies.

Data selection and preservation after research

Which data should be retained for preservation and/or sharing?

The company will retain the original clinical dataset, validated datasets, essential study documentation, data dictionaries, quality-control records and derived pharmacokinetic results.
Analysis scripts, PKanalix project files, statistical outputs and reproducibility documentation will also be preserved to support verification, future modelling and regulatory review.
Data selected for external sharing will primarily include approved aggregated pharmacokinetic results, methodological documentation and non-confidential research outputs. Participant-level data will remain subject to controlled access and applicable data protection requirements.

What is the long-term preservation plan for the selected datasets?

Essential clinical study records, validated datasets and supporting documentation will be archived in a secure, controlled company repository in accordance with applicable regulatory retention requirements.
Long-term preservation will include access controls, audit trails, periodic integrity checks, backup procedures and measures to maintain file readability.
Datasets and supporting documentation will be maintained in appropriate formats to support future analyses, regulatory inspections and continued drug development.

Data sharing

Are any restrictions on data sharing required?

Yes. Access to participant-level clinical, biochemical and pharmacogenetic data will be restricted to authorised personnel to protect confidentiality and comply with GDPR and applicable clinical trial requirements.
Proprietary information relating to Gajeevy's development will also be subject to confidentiality and intellectual property restrictions.
Regulatory authorities and approved research collaborators may receive access to relevant data under appropriate legal and contractual arrangements. Public dissemination will focus on approved, non-identifying results and documentation.

How will you share data selected for sharing?

Approved clinical study data and analytical results will be shared with regulatory authorities and authorised collaborators through secure, controlled-access platforms.

Shared datasets will be accompanied by appropriate metadata, data dictionaries and methodological documentation to ensure accurate interpretation and reproducibility.

Non-confidential aggregated findings may be disseminated through scientific publications, clinical trial reporting mechanisms or suitable research repositories, subject to applicable regulatory, confidentiality and intellectual property requirements.

Responsibilities and resources

Who will be responsible for data management?

Daan Demeulenaere,
Shanice Sokeng Tsake,
Seyed Mostafa Fazel Hosein

Will you need additional resources to implement your DMP?

Yes. Additional resources may be required to ensure effective implementation including secure data storage, regular backups, and controlled access to sensitive clinical trial data. Dedicated personnel with expertise in data management, data protection, and regulatory compliance may also be needed. Additional training and software resources may be necessary to support data quality, traceability, long-term preservation, and reproducibility. These requirements will be assessed throughout the project, and appropriate resources will be allocated as needed.
